c. World technological leadership.

In what? Emphasis on Shuttle allows foreign advantage in expendable launch vehicle technology. Why must the "cutting edge" of technology be in military-related programs with high development costs? See Annex D on NASA R & D Direction.

2. Informal Justifications Are Questionable

DOC's responsibility.

b. Employment.

On a national level, comparable employment could be generated by other programs, in NASA (Science and Applications) or out of NASA (ERDA, private industry). With regard to specific facilities and contractors, the point is valid.

c. Delays raise cost.

May also slow waste.
d. European Space Agency is investing $500 million in Spacelab.

NASA is investing $300 million in Spacelab.

e. Shuttle essential to Space Applications and Space Science.

Although these are presented as the "uses of space" which the Shuttle will expand, they have actually been neglected by NASA's diversion of funds to the Shuttle program.

f. The need to put non-astronauts in space.

At what cost? For practical results or public relations?

g. Adventure and economic growth (See 3.c.(8))

Let us recognize that the Shuttle offers a form of adventure and a vision of the future, and debate it as such. There are different kinds of intellectual, emotional, and physical adventure, and there are alternative visions of the future. Large scale sophisticated technology should have no monopoly on our imaginations.

Let us keep separate the sales pitches that involve international prestige, displays of power, Buck Rogers entertainment. These play up to our insecurities and offer satisfactions and diversions that are artificial.

Where there are Madison Avenue techniques there is the possibility that the Shuttle vision of the future is the favorite of big business. Businessmen may see space manufacturing as a way of maintaining our present types of growth, technology and consumption. Space scientists may see it as a peaceful offshoot of weapons technology, creating different kinds of growth and different social attitudes.

In this vision of the future, in which we are investing billions, space will provide new sources of energy, new materials, new growth, new cures for disease. People will be distracted from population pressures, economic inequalities, and nuclear contamination. (Problems that don't lend themselves to technological solutions are "cultural factors" which are ignored, or thought to be transformed by the future.)

It is possible that technology will change our lives, but is it this Shuttle type of technology?
3. Factual Justifications

a. Shuttle operations could possibly lead to unforeseen genuinely economical space activities that would not be apparent from using only an R & D shuttle.

b. Space operations in the 90's may require a commitment to manned space flight and the physical retrieval of a high percentage of satellite payloads.

4. Reconstructing the Shuttle Decision

By hindsight it would seem that NASA should have studied the missions for space launches before and not after the development of the $30 to $50 billion Shuttle. At the time the decision was made, however, the following conditions prevailed:

--- the Apollo program was ending, forcing traumatic reductions.

--- NASA could probably get more funds from Congress for the Shuttle than it could for Science or Applications.

--- Shuttle research spills over to aeronautics.

--- NASA is oriented toward expensive "hardware."

--- Space Flight was called Manned Space Flight. The thrust of that office is to enable human beings to work in space, which causes NASA to de-emphasize missions that can be accomplished at less cost without human beings.

5. The "Cost-Effectiveness" Argument

a. Cost estimates were obtained from NASA-contracted studies (See Section 3d.)

b. NASA studies underestimate Shuttle costs and over-estimate those of its alternatives. According to the GAO,

(1) NASA has yet to provide an estimate of all Shuttle costs.

(2) NASA's management-to-cost techniques are a way of holding down more realistic field center estimates.
(3) Major Shuttle costs have gone up 50% from 1972 to 1976, and further real and inflationary increases can be expected from budget-caused delays, environmental impact studies, and unforeseen design problems.

(4) Crucial to "cost-effectiveness" are the "savings" made possible by the Shuttle's ability to retrieve space payloads, repair them in space, and utilize lower-cost payload design -- yet these cost benefits are dubious. A separate Shuttle flight is required for each orbit retrieval. Technology advances so rapidly it may be cheaper to build new units than repair old. Designing for heavier and larger payloads means reversing the industry trend toward greater sophistication.

(5) The 58% higher launch rate may be unrealistic; none of the Shuttle's potential users (e.g. Commerce, DOD) has committed itself to a minimum number of missions.

(6) Budget constraints add to program risk because NASA's "cost-effectiveness" model puts pressure on engineers to compress testing schedules rather than on NASA to postpone revenue-generating operations.

c. DOD is to be a major user of the Shuttle, but several Air Force studies have suggested the Shuttle may cost more than expendable vehicles. The Air Force has not released its studies on the feasibility of recovery and re-use of Defense satellites, most of which are in geosynchronous or higher-than-Shuttle orbits.

d. "Cost-effectiveness" is clever:

(1) It diverts attention from "what's it for?"

(2) It conveys frugality by asserting that substantial savings will result if the nation embarks on a $40 billion program.

(3) It justifies follow-on programs, like a permanent space station, to allow us to get our full money's worth. In FY 78 NASA requested $15 million for "Space Industrialization," the wedge for a new dominant mission.
Annex B

Work Impact at Installations

No other program accounts for the same percentage of R & D work as the Shuttle does at Johnson, Kennedy and Marshall. But Shuttle cut-backs would affect Johnson, Kennedy and Marshall as the percentages indicate, over time, only to the extent that there were no programs to replace the Shuttle. NASA tells us that Shuttle R & D resources will be shifted to Science and Applications after the Shuttle becomes operational. If the Shuttle were cut back, that process could start now.

Annex C

Military Space Programs

1. **Size and Objectives**

Only part of DOD's space-related programs are included in military R & D, but the two are shown together, with NASA's incurred obligations, for comparison. The military space "overhead" may be understated.

Spending 38% of U.S. space money, DOD programs should be scrutinized as closely as NASA's. The scrutiny is more difficult, however, due to overclassification, institutional reticence (see paragraph on Shuttle), and scatteration.

The third factor, more reassuring, is the impression that space activities are split up among distinct military missions. It makes empire-building harder to detect because SAMSO turns the programs over to the commands that use them. The Defense Support Program is run by NORAD, the Defense Meteorological Satellite Program by SAC, and the three communications programs, DSCSII, AFSATCOM, and FLTSATCOM, are run by DCA, the Air Force and the Navy. SAMSO is the Air Force unit that develops and launches Defense satellites.

In theory, space programs are approved by hard-nosed commanders who only want the job done most effectively. In practice a relaxed budget may permit redundancy, or placing satellites in operation before they are perfected for peacetime or reliable in wartime.

2. **Overclassification**

There should be a presumption that any information that can be correctly assumed by the Soviet government should be available to the American people. A few highly sensitive activities should not make all others classified as well. Cost should be broken down in greater detail.

The need for various systems must also be explained. Defense communications, for example, already seem adequate: only disinterested officers, forced to make choices, can give us an accurate judgment.

3. The Shuttle

As to how necessary the Shuttle is to improve DOD space capabilities, DOD has made no final judgment. Air Force briefers tick off the Shuttle's selling points: twice the payload weight, three times the volume, in-orbit servicing and testing, retrieval, the ending of DOD-NASA duplication.

But they do not refute the counter-arguments:

--Retrieval, for refurbishment of payloads or failure analysis, is only practical from low orbit. Most DOD satellites go to geosynchronous orbit, which the Shuttle cannot reach.

--High equipment reliability and rapid technological advances reduce the importance of in-orbit servicing, and man-in-space. Long lead-time investments run greater risk of obsolescence.

--What would be the advantages and disadvantages of having men in space in time of war?

--If cost estimates for adapting DOD payloads to the Shuttle are now $700 million, and if DOD must build the IUS, how cost effective is the Shuttle from DOD's point of view?

Several hypotheses suggest themselves to explain why this subject is so difficult to discuss:

--tight security (see paragraph 2).
--decision-makers have not grasped all the technical aspects, and the technical people are too specialized to decide.
--political pressure to accept the Shuttle.
--unwillingness to discuss the issue with non-DOD personnel.
--ties with NASA.

Insights into DOD's "commitment" to the Shuttle will not be available through official channels to any questioner who does not have some power of the purse at Defense.
4. **Ban on Space Weaponry**

**STATEMENT OF HERBERT REIS, LEGAL ADVISER, U.S. MISSION TO THE UNITED NATIONS**

*July 23, 1975*

The four outer space treaties are the Outer Space Treaty, negotiated in 1966; the Astronaut Assistance and Return Agreement, negotiated in 1967; the Liability Convention, the negotiation of which was completed in 1971; and the Registration Convention, completed in 1974. The first of these conventions, the Outer Space Treaty, mandates that outer space and celestial bodies are freely available for exploration and use by every state and cannot be subjected to any claim of national sovereignty or exclusive use. It provides that the obligations of a state under international law to avoid using armed force and to resolve its international differences peacefully apply equally to conduct in space.

The treaty lays down the rule that no state may orbit nuclear weapons or install them on a celestial body. It calls for the encouragement of scientific investigation and establishes international cooperation in space and space-related programs as a fundamental objective of the community of nations, however disparate may be their Earth-based policies. It declares that space activities should be conducted with a view to benefiting all mankind.

The Outer Space Treaty specifically bans nuclear weapons and "other weapons of mass destruction." What initiatives have been taken by the U.S. to negotiate a treaty that would ban all weapons from space?

USAF briefers refer to space as the fourth medium of war, after land, sea, and air. Military space activities account for 38% of the U.S. space budget. Does all this money go to surveillance and communications devices?

Lasers and "killer satellites" are mentioned in trade publications and Congressional hearings. Once these weapons are used, how would the conflict escalate? What would be the effects on the global environment? If opposing satellites today can be likened to the early encounters between aviators in World War I, where are we going? Surely nations that forego chemical and biological warfare can forego weapons in space. Even "knock-out" uses of these weapons could not prevent nuclear retaliation.

The thrust of the Outer Space Treaty, which the U.S. proposed, is that space activities should be conducted for the benefit of all mankind. A complete report must be made on exactly the type and extent of U.S. and Soviet efforts to put destructive devices in orbit.
Annex D

NASA's R & D Direction

1. Development vs. Basic Research

Different fields require different proportions of basic and applied research and development. Since development is costlier than basic research, one R & D program with high development costs may starve many basic research programs. How are the trade-offs made? Obviously a program should not be ruled out because it entails high development costs; yet the economic, employment and political benefits are such that the R & D rationale for the program should be given rigorous objective scrutiny.

2. Constituencies

By natural inclination and by training, specialists tend to believe their specialty can be a major if not a determining factor in the progress of mankind. It would not occur to them that money for their specialty brings them status and power. They believe in their specialty (most of them) for the benefits it brings to others.

When cries in the wilderness are eventually heard and supported by government R & D, what emerges is a political constituency. If a small group shakes the tree successfully a larger group gathers, organizes, and shakes harder. New cries in the wilderness are drowned out.

Once a new elite gains tenure it can shape the thinking and outlook of a younger people for a generation. Rapid social and technological change may leave the experts' formative experiences far behind, but they not only control access to leadership positions, they reproduce themselves in those positions. A scientist in a field that affects our future can reproduce himself, in PhD's. every year, for decades after he has done his "best" work. Section 102 (a)(4) of the new National Science Act reflects the expert belief that R & D depends on greater numbers of scientists and engineers. But it is not the number, it is the kind and their orientation.

3. Other Directions

Alternatives to big technology and economic centralization need not lead to stagnation, an orgy of consumption, or a return to the Middle Ages. It is alleged that today the United States operates with the oldest stock of metalworking machinery of any industrial country, and that 80,0

Source: OMB
of our Federal R & D is related to weaponry. Why is R & D not targeted at new forms of transportation, insulation, clothing, or at products designed specifically for foreign markets, to improve our balance of payments? Why can't we lead the world in low cost products, like Jeeps that cost $1,000, or expendable rocket launchers that cost 20% of current rockets? On the other hand we could increase technical sophistication on a smaller scale. Mindful perhaps of the New York blackout of 1965, the new director of JPL advocates a decentralization of the American economy, based on small scale sophisticated technology, local energy sources, and nation-wide communications.

Defense R & D is not readily transferable to civilian use. Typically it produces units that are few in quantity, high in price. Defense and space R & D are concentrated in developmental R & D, focused on the end product, rather than basic research, which has more general purpose applications. Defense and space R & D draws away scientists and funds from civilian R & D.

Yet new technological directions require not just a neutral government role in R & D, but active government support. Companies have practical difficulties in obtaining market rewards for "blue sky" R & D. Besides, scientific knowledge is a public good. If effective weapons systems require flexibility, obtained by developing a large "menu" of technology, and buying information on alternative systems, why shouldn't the same principle apply to civilian technology?
TO: Nicholas MacNeil  
Carter Mondale Transition Planning Group  
P.O. Box 2600  
Washington, D.C. 20013

FROM: W.A. Rutherford

SUBJECT: Aide Memoir: NASA Transition Overview Paper

1. As I indicated earlier the following information, observations and views are based on material gathered in the course of interviews with various persons inside and outside of NASA before and during the transition period as well as direct personal experience and exposure while working as a consultant to the Agency over the past two years.

1.1 This material is submitted for your information (and may or may not be included in or appended to your final transition report on NASA) and for the best possible utilization as you see fit.
2. ORGANIZATIONAL STRUCTURE + BACKGROUND

There are three major considerations in this area:

2.1 First, as an organ of government NASA is singularly free of centralized Federal government control. The Senate and House Committees with legislative oversight responsibilities, along with OMB are the only real "controlling" forces or influences on the Agency, and its proven effectiveness in "lobbying" members of Congress have measurably lessened the impact of the former.

2.4 In fact many Centers and Center Directors (including a number of outstanding Scientists - Werner Von Braun is an Alumnus of the Marshall Space Flight Center- and several former Astronauts) have their own contacts, supporters, friends and lobbyists in the Congress, in various Government Agents as well as professional and public followers making them potent forces to deal with and reinforcing their independence from central and external controls.
3. SOME PROBLEM AREAS

3.1 General

This situation has a great deal to do with the array of problems confronting the Agency. The in-group, esoteric atmosphere mentioned earlier has seen the creation of an "old boy-network" among the staff; a number of questionable procurement procedures including early construction and acquisitions outside normal federal channels and constraints; favoritism in grants and awards to universities, companies and individuals; notoriously unequal personnel practices; costly programs and operations and a serious absence of direction and planning in the overall management of the Agency.

4.3 In fact NASA has a notoriously bad EEO standing. With some 16,000 personnel they presently have only a 7.4 percent minority participation in the workforce - up from only 5.4 percent four years ago. Of the first 20 Federal Agencies NASA is 20th or last. The Agency is beset by a growing number of discrimination complaints and is being taken to court in a medley of class action suits.
4.5 The fact is that the Agency's planned rate of increased minority involvement is only 8/10ths of 1 percent annually. At this rate they do not even expect to reach EEO parity with other Federal Agencies until 1985. Many question whether with management's current lethargic programs parity will be achieved even then.

4.6 The Agency uses the classic excuse that the scientific and technical nature of their work make it difficult to recruit qualified minorities. However the fact of the matter is that only 48% of NASA's work force is scientific or technical. Yet the minority figure is still far below parity in the other 52% of the work force.

4.8 Similarly, minorities and women are totally absent from many key areas of Agency management or are only represented in token numbers.

4.9 NASA procurement, university grants, education office publications and public affairs offices all have only limited and token programs involving minority communities - if at all.

5. REORGANIZATION/CONSOLIDATION

5.1 A clear case can be made for the reorganization and consolidation of those Government Agencies involved in space and space related activities. The Agencies that have major programs in these areas in addition to NASA are notably the Department of Defense, ERDA, NSF.
5.2 NASA Officials express interest in and approval of the concept of a National Science and Technology Agency but make a clear cut distinction between Space Research and applications of research in specific areas. The hiatus is between the developers and the users, as they see it, and would influence their role as the "umbrella" Agency.

6. SOME RECOMMENDATIONS

6.1 That a major management study of the Agency be conducted especially regarding the planning, program development and decision making processes.

6.2 That the decentralized semi-autonomous Center's system be eliminated, and a centralized line of operational and program authority be established.

6.3 Develop new Equal Employment policies, programs and staff.

6.4 Install a management by objective system for program development.

6.5 Better coordinate research and share facilities, information and equipment with other Federal Agencies doing related work such as the Air Force, DOD, ERDA, NOAA, etc.

6.6 Improve community relations and public affairs programs to involve and better inform the public
In order to shed some additional light on the subject of top level management talent (TLMT), which the Agency has a "problem" in acquiring (See Fact Sheet #6), the following curves are provided for your perusal:

ing solar power in orbit and beaming it down to earth, the President indicated that these kinds of things tend to happen much more quickly than we now expect and that we should not hesitate to talk about them now. He was also interested in the nuclear waste disposal possibilities. The President liked the fact that ordinary people would be able to fly in the shuttle, and that the only requirement for a flight would be that there is a mission to be performed. He also reiterated his concern for preserving the skills of the people in the aerospace industry.

In summary, the President said that even though we now know of many things that the shuttle will be able to do, we should realize that it will open up entirely new fields when we actually have the capability that the shuttle will provide. The President wanted to know if we [2] thought the shuttle was a good investment and, upon receiving our affirmative reply, requested that we stress the fact that the shuttle is not a "$7 billion toy," that it is indeed useful, and that it is a good investment in that it will cut operations costs by a factor of 10. But he indicated that even if it were not a good investment, we would have to do it anyway, because space flight is here to stay. Men are flying in space now and will continue to fly in space, and we'd best be part of it.

2. International Cooperation. The President said that he is most interested in making the space program a truly international program and that he had previously expressed that interest. He wanted us to stress international cooperation and participation for all nations. He said that he was disappointed that we had been unable to fly foreign astronauts on Apollo, but understood the reasons for our inability to do so. He understood that foreign astronauts of all nations could fly in the shuttle and appeared to be particularly interested in Eastern European participation in the flight program. However, in connection with international cooperation, he is not only interested in flying foreign astronauts, but also in other types of meaningful participation, both in experiments and even in space hardware development.

3. USSR Cooperation. The President was interested in our joint activities with the USSR in connection with the probes now in orbit around Mars. We also described to him the real possibility of conducting a joint docking experiment in the 1975 time period. The prospect of having Americans and Russians meet in space in this time period appeared to have great appeal to the President. He indicated that this should be considered as a possible item for early policy level discussions with the USSR.

The president asked John Ehrlichman to mention both the international aspects of the shuttle and the USSR docking possibilities to Henry Kissinger.

George H. Low
cc: A/Dr. Fletcher

Document III-33

Unlike Presidents-elect Kennedy and Nixon, Jimmy Carter did not appoint a blue ribbon group on space during his post-election transition. Instead, the NASA transition paper was prepared by one individual who took a generally skeptical view of NASA and most of its programs. Unlike earlier space transition reports, this document was completed after President Carter entered the White House.
Summary

1. NASA's priorities are on the development end of R & D, not the basic research end. NASA directs our R & D resources toward centralized big technology, maintaining the defense R & D orientation of the aerospace industry.

2. The Shuttle has become the end, rather than the means, because NASA space policy has been shaped by the Office of (Manned) Space Flight. The Offices of Space Science, Applications, and Aeronautics Technology get the funds that are left over.

3. Alternative directions for space technology may be neglected because
   (a) the Administrator's power to hire and fire top management inhibits effective dissent
   (b) important NASA managers are from Defense and the aerospace industry
   (c) NASA's budget is supported and approved by a space constituency....

1. Budget History

Perhaps the agency's growth, retraction, and resiliency can best be seen in its level of employment since 1962.

In real year dollars NASA funding is 70% [of what] it was in its peak year, and increasing....

3. Funding Justifications Unconvincing
   a. NASA Mission Unclear

Much apprehension and uneasiness about the NASA budget would disappear if the civilian space program, like its military counterpart, had clear objectives related to national goals.

DOD, with 38% of the space budget, would deny that its space efforts constitute a program; Defense programs are not ends but rather the means of accomplishing certain military missions, the purpose of which is to defend the nation and its allies from attack. Space programs have to compete with other means of accomplishing the same mission.

The entire NASA budget, on the other hand, is considered R & D. According to the National Science Foundation, "R & D is not an end in itself but is a means whereby national goals can be achieved more effectively and efficiently...."

What are these goals? NASA has more difficulty than most agencies in describing...

R&D program proportions:
- 59% of 1.19 = .70
- 15% of 1.19 = .18
national goals in such a way that its programs relate to them. The law establishing NASA is no help in this regard. The National Aeronautics and Space Act of 1958 declares that the general welfare and security of the United States require "adequate provision" for aeronautical and space activities. But then it states that NASA must contribute to one or more of eight objectives, several of which go far beyond the usual understanding of welfare and security. Are we called as a nation to something greater than our welfare and security? There is no guide in law as to what provision is "adequate" for NASA's programs.

b. The Budgeting Process

Budgeting decisions are made in a framework provided by space scientists and engineers. This term is short-hand for those employed by NASA, by the aerospace industry, and by the universities. They decide what NASA's mission in space is . . . , they tell us the value of space activities, and they largely determine the share of available funds each program receives . . .

The club seems to achieve a Consensus in-house, by rallying around those programs with enough political appeal to have a spill-over or logjam-breaking effect for the most members. Thus seldom will scientists or engineers openly criticize programs that they consider ill-advised. Budget requests are made to OMB and the public with as little open dissent and as much gravity and consensus as possible. This behavior is the result of a shared outlook. It is aggravated by the ease with which most professional groups accept the "responsible" consensus.

It is true that independent budget evaluations are attempted by OMB, the Appropriations and Budget Committees, and the GAO. But as long as there is a general consensus within the club, and as long as evaluations are based on NASA-commissioned studies, these economy-oriented critiques will not be effectual. Indeed, not all these authorities are economy-oriented. As staffers become familiar with space activities they become interested in them. If pressures build to stimulate the economy, what better place than in one's favorite R & D program?

c. Unconvincing Arguments

Most agencies have a wide range of arguments to back up budget requests but they usually use these arguments informally. At budget hearings an agency will try to keep it simple. Informal arguments might lose some of their appeal to individual interests if they were listed together, and exposed to criticism.

Critics of a particular program would do a service if they took issue not only with the program's formal justification but with all the other claims that are made in support of it. However, the critic runs the risk of strengthening his case logically and weakening it here

and there politically. Inaccurate claims can usually be asserted more quickly than they can be refuted.

Unconvincing arguments tend to weaken the aura of scientific invincibility and suggest a bureaucratic tendency to keep trying a multitude of arguments to weaken people's resistance, or to provide that particular argument which one group can accept. This list is by no means complete.

(1) The "Critical Threshold" Argument

NASA will maintain that funding must be kept at a certain level to preserve the necessary scientific and engineering base in people and facilities.

There is no one threshold, but a series of thresholds depending on the level and the purpose of R & D. The concept itself is suspect: if a base could be created when needed, it can be recreated. The costs of starting it up must be balanced against the costs of an entrenchment process that diverts the government's attention and funds from new problems, or new approaches to old problems.

(2) NASA's Stimulative Effect on the Economy

It is claimed that NASA expenditures are highly labor intensive, have a high multiplier effect, are not inflationary, and return the investment many times over due to the advanced technology involved.

Aside from the fact that these are the findings of studies commissioned by NASA (see following section on vested experts), the point is not how stimulative NASA spending is in absolute terms, but how stimulative it is compared to equivalent spending by some other agency in some other sector, or by different fiscal and monetary policies.

(3) The Level Budget "Commitment" of January 1972

NASA often refers to OMB assurances that it would have a funding floor in constant dollars to build the shuttle. Actually the "commitment" was made by NASA, not by OMB. The political process does not permit long-term commitments to controversial programs, yet claims of a "commitment" are still heard.

(4) The "Cutting Edge" of Technology

In simplest form this argument holds that what makes America preeminent is advanced technology, and that we depend on it for our defense and foreign exchange earnings. The "cutting edge" is never far from nuclear energy and the aerospace industry, and in these areas the high quality of research brings the highest return on our R & D dollars.

This argument confuses the value of R & D with subjective judgments on the value of different types of R & D. The issue should not be whether aircraft sales are a major earner of foreign exchange, but whether some other industry would have produced greater social and economic benefits if an equivalent amount had been invested in it. As to quality of
research, talent follows money.

Our military and space efforts might well benefit from cheaper, more numerous and more expendable units. See Annex D).

(5) Individual Science Programs Vital

This tactic is to evaluate individual science programs in isolation from basic research policy. The stress is on the worthy objective and not on whether the program is cost effective, or whether data are related to results from recent or concurrent programs, or whether technology offers the possibility of leap-frogging to a more advanced stage.

The Space Telescope is a case in point. If observations are vastly improved outside the earth's atmosphere, why have observatories been built or upgraded recently in Chile, Mexico, Hawaii, Puerto Rico, and Arizona? Is there duplication from military space programs?

(6) National Security, or A Race with the Russians

The space club is not averse to taking a page out of DOD's book. When pressed, NASA will disclaim competition, but say the Russians are ahead.

DR. FLETCHER. We don't regard ourselves as being in a race with the Soviet Union. We do feel that we cannot fall too far behind in technology.

Some proponents will say that NASA programs have profound security implications. These claims suggest that DOD does not recognize certain defense needs, or that NASA should pay for a certain part of national defense.

(7) International Prestige

Akin to national defense is the notion that to keep our political and cultural values in high esteem, here and abroad, we must periodically give a display of technological virtuosity. Perhaps a winning team in sports or technology helps Americans feel less threatened by foreign developments beyond our control. We transfer vigor and Number 1 status in a particular field, to the nation as a whole. Selling international prestige on this basis panders to people's insecurities.

(8) The Call of Adventure

Adventure covers a variety of appeals to our emotions and imaginations.

- Vicarious space travel: e.g. the Shuttle will have hygienic facilities for both men and women and that "average" people—non-astronauts—will be placed in orbit, to obtain the "liberating perspectives" of space.

- Creativity: e.g. the space program fills the same human need as cathedral-building in the Middle Ages.

- An Alternative to War: e.g. World War I might have been avoided if European nations could have vented their aggressiveness on space operations rather than armaments.

- A New Start for Mankind: e.g. artists' conceptions of space colonies, space factories.

- America's Destiny: e.g. the United States is the only country on this planet that can answer the riddle of man.

- Spectator Sport: e.g. Astronauts—technological sports figures—may do more to heighten this sense of adventure than to justify the added expense of manned over un-manned space missions. Perhaps they can be likened to a strong football team, that provides the gate receipts to support other athletic programs.

As with the international prestige appeal, there is a touch of "Madison Avenue" to this—space is more than R & D—it is patriotism, "gee-whiz" technology, entertainment, creativity, our national destiny. But the very success of these appeals to our emotions and imaginations shows that welfare and security are not the total of human aspiration. We enter a decision-making area full of risk for public policy which imposes certain responsibilities on government officials. Programs funded emotionally often lead to waste, empty psychological gratifications, and inflation. Ancient and recent history offer examples of peoples who have asserted their values and spirit in unprecedented, uneconomic programs that drained them, sometimes fatally, of their vitality and resources. The display of power was as important as the end it was put to. See Annex, Shuttle Justifications, 2g.

But non-economic or "irrational" motivations do exist, and they carry the potential for great creativity as well as great waste. Adventurous social programs and R & D programs
have given us new knowledge, new powers and perhaps a new identity. Thus it is essential
to argue over what kind of adventure we are getting into, and the costs. This is almost
impossible when budget requests are made entirely on economic grounds, and the appeal
to non-economic motivations is under the table. (See Recommendations.)

(9) Fait Accompli Statement

"The debate over manned vs. unmanned space flight was settled by the decision to
build the Shuttle." This ploy can be used for most programs. It was a favorite for continu-
ing the Vietnam war.

d. Expert vs. Popular Opinion

Related to the consensus of scientists and engineers with regard to budget requests is
the absence of an outside vantage point that the layman could turn to for a professional
but fresh perspective. The problem goes beyond the natural similarity of viewpoint of
persons in the same field. As then Senator Mondale asked on May 9, 1972:

How can Congress and the public approve massive spending on new technology pro-
grams without the benefit of independent evaluations of such programs?

NASA's contractors are not likely to offer opinions which have not been checked
with NASA. At times estimates suggest a form of blackmail:

NASA said that if the expendable alternate were selected, a further analysis might
increase the development cost of the new expendable (launch vehicles) by about 1 billion
dollars.1

On the one hand there must be a taxpayer counterweight to vested expert opinion.
On the other hand there must be disinterested expert opinion to dampen public enthusi-
asm for space programs based on psychic gratifications rather than economic or scientific
returns. Those who find entertainment or the solution to war in space may ultimately push
space expenditures higher than space scientists and engineers. The object of both coun-
terweights is to use national resources wisely.

4. Recommendations

a. Outline National Goals—for example—

(1) The President's Economic Goals:
   - 4 1/4% unemployment by 1981
   - inflation under x%
   - a balanced budget, amounting to 21% of GNP
   - a relatively favorable balance of trade
(2) Defense Against Military Threat
(3) Pollution at Acceptable Levels
(4) International Collaboration, Project Humanitarian Values
(5) Scientific Discovery
(6) A program to Express National Values and Energy (?)

b. Outline Corresponding Space Programs—for example—

(1) Defense Satellites
(2) Scientific Probes, Experiments
(3) Economic Application Satellites (crop and weather forecasting, resource
    management)
(4) Pollution Detection Devices
(5) Public Service Satellites (education, search and rescue)
(6) Solar Energy Platform
(7) Reimbursable Projects (communications satellites, space manufacturing)
(8) International Cooperative Ventures (To train foreign scientists, share
    information, share the expense, use and seek superior talent.) To make
    these ventures effective the U.S. should avoid paternalism, or the notion
    that our resources give us a Manifest Destiny in space.

1 Note that there is no comparison of total development costs of expendable and reusable launch sys-
tems.
EXPLORING THE UNKNOWN

(9) Experimental Civilian R & D Develop technology that applies to the way people live now, in this country and abroad
See Annex D, NASA's R & D Direction.

c. Accurate Labelling
Avoid the scientific mystique. Justify programs in terms of all other activity being carried out to achieve the same broad objective. Set forth all the arguments used to support the program, strong or weak, point by point, if the program is based partly on non-economic considerations, such as curiosity or adventure, make that part of the appeal explicit, so that the rest of us can recognize the trade-offs and judge for ourselves whether the adventure will strengthen or weaken us in the long run.

d. Downgrade Economic Objectives
Economic stimulation should take a back seat when R & D programs are funded, because these programs invest in personnel and facilities that are far more specialized and influential, and multiply more rapidly, than the constituencies of non-R & D programs. Multiplying the supply of program administrators multiplies the demand for more of the same. This skews the economy more than it stimulates it. See Annex D, NASA's R & D Direction, Constituencies.

e. Curb Budget Expansion
Through Executive Order establish an obstacle course of hearings, studies and consultations for budget increases over, say, 5%. Once a benchmark budget has been set, vary the size of the slices, not the pie.... When priorities change, resources must be shifted, not added on. Scientists and engineers should be encouraged to blunt their spears on each other rather than the Administration.

f. Use a Science/R&D Jury to Recommend R & D Priorities to the President
Appoint a Science/R&D Council, headed by the Vice President, made up of distinguished laymen, to recommend allocation of R & D funding as to function and agency....

This Council would not resemble the President's new Committee on Science and Technology. It would present the president with a proposed R & D budget. Its members would represent labor, business, education, consumers, the press and other sectors without being weighted 2 to 1 in favor of engineers, scientists and bureaucrats. The members would serve full-time, for a year, without staff.

The Council would hear expert testimony from scientists, engineers, and those most knowledgeable about R & D. Its recommended budget would include military as well as civilian R & D in the space field. for example, the members would have security clearances adequate to allow them to try to fund military and space programs from the same "pie," minimizing duplication and maximizing multiple missions.

Discussion:
In seeking impartiality for decision-makers it would seem logical to assign laymen to determine the over-all size of the Science/R&D budget, and scientists and engineers to decide how the R & D pie will be divided. But more impartiality can be achieved by reversing the roles.

At the level of deciding between the nation's R & D and other non-defense goods and services (assuming this model is accepted, laymen are not disinterested, and may be too shortsighted to see the value of R & D, whereas the parochialism of scientific and engineering opinion would be less at the overall R & D level than at the level of funding individual R & D programs. At the program level, experts seek national commitments to their own programs, thus tending to jack up overall R & D on political considerations. Expert opinion at the over-all R & D level, however, might dampen this effect. A compromise would be to set R & D within a narrow percentage range of general spending (not GNP).

R & D priorities are as political as they are scientific. A full debate is necessary. Without it we will be less likely to achieve mid-range budgetary stability and more importantly the lead-time necessary for contractors and scientists to prepare themselves for new problems and priorities.
The Evolution of U.S. Space Policy and Plans

**Agency and Mission Shares of R&D**

- Missiles: 11%
- Aircraft: 10%
- Space Science: 51%
- tanks: 12%
- Other DOD: 17%
- NIH: 9%
- Other ERDA: 3%
- Other HEW: 2%
- NSF: 2.5%
- Ag: 2.2%
- EPA: 1.3%
- DOT: 1.3%
- Int: 1.3%

Recommend jury concept to weaken proponents of individual R&D programs, Presidential backing to provide lead-time for contraction and expansion.

**Federal Expenditures**

- R&D: 5.5% of total—recommend planning based on an optimum percentage.

g. Enforce ONE Circular A-109; Decentralize

Depending on how one defines a need, circular A-109 could have prevented the Shuttle controversy. The circular states:

"When analysis of an agency's mission shows that a need for a new major system exists, such a need should not be defined in equipment terms, but should be defined in terms of the mission, purpose, capability, agency components involved, schedule and cost objectives, and operating constraints."

The present arrangement allows Space Flight to turn to Space Science and Space Applications and say "Here is your equipment, the Shuttle. Make use of it." Manned Space Flight will then find a new project. When it can no longer carry the expense of the Spacelab, or Space Industrialization, it will turn these half-started programs over to Science or Applications, the offices which should have controlled R & D from the beginning.

To take mission-orientation further, overhead could be funded out of the end-result offices (Science, Applications, and OAST). The NASA Comptroller would be split in three, and those three offices would draw up budget requests for C of F and R & PM. Facilities would bill those 3 offices for services rendered. (OMB and the GAO would have to ensure that billings represent the full cost of government facilities and personnel.) In effect all work would be contracted out, to either private or government contractors, whichever program management preferred.

Some of the advantages of decentralized budgeting are the following:

- it would weaken the agency's hierarchy, its institutional values, its growth as a bureaucracy.
- it would force economies on laboratories and facilities of marginal usefulness.
- it would increase the practical applications of independent (unstructured) R & D.
- it would make programs available to facilities, and facilities available to programs, across the board. Facilities and laboratories affected would be subject to a wider range of ideas and work opportunities.
- it would require ways of making the Civil Service more responsive to public needs.

h. Reorient NASA Leadership

Section 203 (b) (2) of the 1958 Aeronautics and Space Act allows the ASH Administrator to hire up to 425 executives, and set their salaries to the top Civil Service grades. This high number of excepted positions tends to unify top management. Unity is more beneficial to the implementation of policy than to the formation of it.
This system naturally lends itself to the notion of a network, and a perception that when RIFs come the Civil Service takes a disproportionate share. The system may also be related to NASA's poor Equal Employment Opportunity (EEO) record, discussed in Annex E.

Disturbing also is the number of former military personnel and former NASA contractors within the excepted positions. They cannot help but affect relations between NASA, Defense, and industry, and the kinds of work that NASA undertakes. Likewise a survey should be made of where NASA scientists have done their work. There may be a certain parochialism among the prestige institutions. This too may affect the kinds of work NASA does, who does it, and where.

If the thrust of this memorandum is followed, a new Administrator will have to come from outside the space club. He or she will have to be willing and able to use his authority to remove NASA veterans from excepted positions, and replace them with younger professionals. The purpose of these changes would be:

- to make NASA's personnel system more responsive to need, not less.
- implement the spirit of EEO.
- offset the steady increase in the average age of NASA employees.
- encourage disciplined dissent.

i. Postpone the Appointment of a Science Adviser (OSTP) and a NASA Administrator Until These Issues Have Been Discussed

Do not approve new starts at NASA until the budget decision-making has been studied. Do not be rushed. If an attempt is made to challenge the experts who choose our options, appoint science and R & D officials who will support the new approach and make it work.

5. Options

The three options listed probably bear little relation to OMB options, which reflect expert opinion. My options suggest that we explore new directions for R & D, that we not commit ourselves to Shuttle operations, regardless of "cost-effectiveness," and that we give laymen a share in setting R & D priorities. To sum up, the options are based on keeping control of the agency.

The options also reflect a bias toward Space Applications. Admittedly there are no options as to how Applications could use additional resources, but current NASA emphasis suggests that money (and talent) thrown at this area could bring significant results.

Option 1 - Appoint "jury" to recommend all R & D program priorities.

Budget effect - Unlikely to change level of space funding, but might favor Applications over Flight and Science.

Discussion

OMB states that R & D funding "is not a separately program[med] or budgeted activity of the Federal Government. Its funding must therefore be considered primarily in light of the potential contributions of science and technology to meeting agency or national goals and not as an end in itself."

Realizing that "therefore" belongs to the first sentence, not the second, the crucial point is that agency or national goals are slurrl together. There is often a time-lag between agency goals and new perceptions of how national goals can be achieved. Since R & D needs more lead-time it is important that agency R & D decisions be subject to modification by a group with a totally national perspective.

---

1 OMB may not see this as a problem. In discussing NASA's FY 1979 budget request, an OMB report states: "Substantial flexibility exists for reducing future year funding based on long-range policy and budget decisions in future budgets"—as if a program's constituency did not grow and gain a wider hearing, as if our investment does not bind us tighter to a program, with each passing year.
Advantages
1. Less overlap between military and civilian space programs.
2. Build broader consensus for longer-range planning, more lead-time for contractors.
3. A form of Executive oversight over Defense R & D.
4. More attention to national goals than agency goals.

Disadvantages
1. "Jury" unqualified to grasp issues involved.
2. "Jury" will become the captive of a particular R & D faction.

Option 2 - Build only three Shuttles. Use Shuttle for R & D and as required by individual missions.

Budget effect - Gradual reduction instead of sharp increase in Shuttle expenditure.

FY 1978 is build-up year.

Discussion
Using the Shuttle as an R & D program for launch and payload reusability, while improving expendable systems, will provide greater flexibility. Some resources can be shifted to Space Applications. Publicize DOD distrust, and Mondale, Proxmire and GAO objections. OMB notes "widely divergent views."

Advantages
1. Change the big-program legacy of NASA; redirect R & D from "producers" to "consumers."
2. Take advantage of new broom; use press and public concern over inflation and bureaucracy.
3. Decision to put "Carter imprint" on Applications, give shuttle contractors an advantage in seeking Applications contracts.
4. Catch up in expendable vehicle technology, building Fords instead of Cadillacs.
5. More Science and Applications value per dollar spent, less drama.

Disadvantages
1. Political repercussions from areas surrounding affected facilities.
2. Wide currency of "cost-effectiveness" argument.

Option 3 - Expand the NASA charter to provide limited funding for specified technological breakthroughs.

Budget Effect - None.

Discussion
NASA coordinates with other agencies, industry and academia. It has capabilities in energy research, materials development, and across the spectrum of advanced technology. It put a man on the moon. It thinks more about the future than other agencies.
Why not challenge NASA to find technological breakthroughs to problems here on earth? NASA would serve as a gadfly, to weaken monopolization of R & D fields by other
agencies. Congress and NASA would draw up a list of problems most susceptible to new technology, and NASA would in effect bid for a contract. New automobiles, insulation, and housing modules come to mind. See Annex U, NASA's R & D Direction, section 3.

Advantages
1. Encourage new interdisciplinary approaches to old problems....

Disadvantages
1. Maintain unneeded personnel and facilities on harebrained schemes.

Document III-34

This directive resulted from a comprehensive review of U.S. space policy and programs undertaken during the early months of the Carter administration. It dealt primarily with the relationships among the civilian and national security portions of the national space program; its policy guidance with respect to the national security aspects of the effort was highly classified. The review was carried out under the auspices of the National Security Council, and it established a National Security Council Policy Review Committee chaired by the Director of the White House Office of Science and Technology Policy, Frank Press, as the mechanism for space policy formulation.

[1]

Presidential Directive/NSC-37
May 11, 1978

This directive establishes national policies which shall guide the conduct of United States activities in and related to the space programs and activities discussed below. The objectives of these policies are (1) to advance the interests of the United States through the exploration and use of space and (2) to cooperate with other nations in maintaining the freedom of space for all activities which enhance the security and welfare of mankind.

1. The United States space program shall be conducted in accordance with the following basic principles.

[2] a. [paragraph deleted during declassification review]

b. The exploration and use of outer space in support of the national well-being and policies of the United States.

c. Rejection of any claims to sovereignty over outer space or over celestial bodies, or any portion thereof, and rejection of any limitations on the fundamental right to acquire data from space.

d. The space systems of any nation are national property and have the right of passage through and operations in space without interference. Purposeful interference with operational space systems shall be viewed as an infringement upon sovereign rights.

e. The United States will pursue Activities in space in support of its right of self-defense.

f. [paragraph deleted during declassification review]

g. The United States will pursue space activities to increase scientific knowledge, develop useful civil applications of space technology, and maintain United States leadership in space.
